ECE 133A HW 1

Lawrence Liu

October 18, 2022

Exercise T8.8

For a specific t_i we have

$$f(t_i) = y_i$$

$$\frac{c_1 + c_2 t_i + c_3 t_i^2}{1 + d_1 t_i + d_2 t_i^2} = y_i$$

$$c_1 + c_2 t_i + c_3 t_i^2 = y_i (1 + d_1 t_i + d_2 t_i^2)$$

$$c_1 + c_2 t_i + c_3 t_i^2 - y_i d_1 t_i - y_i d_2 t_i^2 = y_i$$

Therefore we can construct a matrix A and a vector b, such that $A\theta = b$, where $\theta = [c_1, c_2, c_3, d_1, d_2]^T$. We have that for 5 values of t_i and the corresponding 5 values of y_i ,

$$A = \begin{bmatrix} 1 & t_1 & t_1^2 & -y_1t_1 & -y_1t_1^2 \\ 1 & t_2 & t_2^2 & -y_2t_2 & -y_2t_2^2 \\ 1 & t_3 & t_3^2 & -y_3t_3 & -y_3t_3^2 \\ 1 & t_4 & t_4^2 & -y_4t_4 & -y_4t_4^2 \\ 1 & t_5 & t_5^2 & -y_5t_5 & -y_5t_5^2 \end{bmatrix}$$

and

$$B = \begin{bmatrix} y_1 \\ y_2 \\ y_3 \\ y_4 \\ y_5 \end{bmatrix}$$

Therefore we can then just solve for θ with $\theta = A^{-1}b$.

Thus for the values of t and y given, we can get the values of theta with the following code:

```
 \begin{split} t = & [1,2,3,4,5] \\ y = & [-1,12,10,1,-3] \\ A = & zeros (5,5) \\ for & i = 1:5 \\ & A[i,:] = & [1,t[i],t[i]^2,-y[i]*t[i],-y[i]*t[i]^2] \\ end \\ print("theta = ") \\ println (round.(A\y,digits = 3)) \end{split}
```

We get that

$$\theta = \boxed{(-6.117, 6.99, -1.322, -0.709, 0.158)}$$

Exercise T8.10

Squaring these, we get that for $1 \le i \le 4$:

$$\rho_i^2 = ||x - a_i||^2$$

= $(x_1 - a_{i1})^2 + (x_2 - a_{i2})^2 + (x_3 - a_{i3})^2$

Subtracting ρ_4^2 from the others, we get that for $1 \leq i \leq 3$

$$\rho_i^2 - \rho_4^2 = (2a_{41} - 2a_{i1})x_1 + a_{i1}^2 - a_{41}^2 + (2a_{42} - 2a_{i2})x_2 + a_{i2}^2 - a_{42}^2 + (2a_{43} - 2a_{i3})x_3 + a_{i3}^2 - a_{43}^2$$

Therefore for the values of ρ_i and a_i we get that:

$$x = (0.605, 0.405, -0.503)$$

Which can be found with the following code in Julia

```
\begin{array}{lll} & & & \text{for } i = 1:3 & & & & & \\ & & & b \, [\, i\, ] = rho \, [\, i\, ]\, \, ^2 - rho \, [\, 4\, ]\, \, ^2 \\ & & & \text{for } j = 1:3 & & & \\ & & & M \, [\, i\, ,\, j\, ] = 2*(A \, [\, 4\, ,\, j\, ]\, -A \, [\, i\, ,\, j\, ]\, ) \\ & & b \, [\, i\, ] + = A \, [\, 4\, ,\, j\, ]\, \, \, \, ^2 - A \, [\, i\, ,\, j\, ]\, \, ,\, ^2 \\ & \text{end} & & \\ & \text{end} & & \\ & \text{end} & & \\ & & \text{x=M} \, \backslash \, b \\ & \text{print} \, (\, "\, x = \, "\, ) \\ & \text{println} \, (\, round\, .\, (\, x\, ,\, digits = 3)) \\ & \text{for } i = 1:4 & & & \\ & & \text{println} \, (\, norm\, (\, x - A \, [\, i\, ,\, :\, ]\, )\, ) \\ & \text{end} & & & \\ \end{array}
```

Exercise A3.8

(a)

We have that $f(s_k, t_k) = \sum_{i=1}^{3} \sum_{j=1}^{3} c_i j s_k^{i-1} t_k^{j-1} = y_k$, then we will have

$$A = \begin{bmatrix} 1 & t_1 & t_1^2 & s_1 & s_1t_1 & s_1t_1^2 & s_1^2 & s_1^2t_1 & s_1^2t_1^2 \\ \vdots & \vdots \\ 1 & t_9 & t_9^2 & s_9 & s_9t_9 & s_9t_9^2 & s_9^2 & s_9^2t_9 & s_9^2t_9^2 \end{bmatrix}$$

$$x = [c_11, c_12, c_13, c_21, c_22, c_23, c_31, c_32, c_33]^T$$

$$b = \begin{bmatrix} y_1 \\ \vdots \\ y_9 \end{bmatrix}$$

(b)

Using the code below:

```
\begin{split} &S = [0\;,0\;,0\;,1\;,1\;,1\;,2\;,2\;,2] \\ &T = [0\;,1\;,2\;,0\;,1\;,2\;,0\;,1\;,2] \\ &Y = [4\;,0\;,5\;,7\;,4\;,9\;,0\;,3\;,4] \\ &M = \texttt{zeros}\;(9\;,9) \\ &\text{for } k \;\; \text{in} \;\; 1:9 \\ &\quad \text{for } i \;\; \text{in} \;\; 1:3 \end{split}
```

$$\inf_{\substack{M \, [\, k \, , 3 \, * \, (\, i \, -1) + j \,] = S \, [\, k \,] \, \widehat{} \, (\, i \, -1) * T \, [\, k \,] \, \widehat{} \, (\, j \, -1)} \\ \text{end} \\ \text{end} \\ \text{end} \\ \\ \text{println} \, (M \backslash Y)$$

We get that

$$c_{11} = 4.0$$
 $c_{12} = -8.5$ $c_{13} = 4.5$
 $c_{21} = 8.0$ $c_{22} = -3.25$ $c_{23} = 1.75$
 $c_{31} = -5.0$ $c_{32} = 4.75$ $c_{33} = -2.25$

Exercise A4.3

we have, that in order for $(A + uv^T)$ to be nonsingular, there must exist a matrix B such that $(A + uv^T)B = I$. Therefore need to prove that

$$\begin{split} (A+uv^T)\left(A^{-1}-\frac{1}{1+v^TA^{-1}u}A^{-1}uv^TA^{-1}\right) &= I \\ (A+uv^T)\left(A^{-1}-\frac{1}{1+v^TA^{-1}u}A^{-1}uv^TA^{-1}\right) &= I - \frac{1}{1+v^TA^{-1}u}uv^TA^{-1} \\ &+ uv^TA^{-1} - \frac{1}{1+v^TA^{-1}u}uv^TA^{-1} \\ &= I - \frac{1}{1+v^TA^{-1}u}uv^TA^{-1} \\ &+ uv^TA^{-1} - \frac{(v^TA^{-1}u)}{1+v^TA^{-1}u}uv^TA^{-1} \\ &= I - \frac{1}{1+v^TA^{-1}u}uv^TA^{-1} \\ &= I - \frac{1}{1+v^TA^{-1}u}uv^TA^{-1} + uv^TA^{-1} \\ &= I - uv^TA^{-1} + uv^TA^{-1} \end{split}$$

Therefore we have that A is singular if $1 + v^T A^{-1} u \neq 0$, ie if $v^T A^{-1} u \neq -1$, and that $(A + uv^T)^{-1} = A^{-1} - \frac{1}{1 + v^T A^{-1} u} A^{-1} uv^T A^{-1}$.

Exercise A4.12

(a)

When a = 1, because this would make the columns not linearly independent.

(b)

We will have that

$$A^{-1} = \begin{bmatrix} c_1 & 0 & \cdots & 0 & c_2 \\ 0 & c_1 & \cdots & 0 & c_2 \\ \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & c_2 & \cdots & c_1 & 0 \\ c_2 & 0 & \cdots & 0 & c_1 \end{bmatrix}$$

Therefore we must have that

$$c_1 + \alpha c_2 = 1$$

$$c_2 + \alpha c_1 = 0$$

thus we get that $c_2 = -\alpha c_1$ and thus

$$c_1 = \frac{1}{1 - \alpha^2}$$

$$c_2 = -\frac{\alpha}{1 - \alpha^2}$$

Exercise A4.9

(a)

We have

$$YX = B^{\dagger}A^{\dagger}AB$$
$$= B^{\dagger}IB$$
$$= B^{\dagger}B$$
$$= I$$

I is symmetric, so YX is symmetric

(b)

(c)

We have that

$$YXY = B^{\dagger}A^{\dagger}ABY$$

$$= B^{\dagger}IBY$$

$$= B^{\dagger}BY$$

$$= IY$$

$$= Y$$

(d)

We have

$$XYX = ABB^{\dagger}A^{\dagger}AB$$

$$= ABB^{\dagger}IB$$

$$= ABB^{\dagger}BY$$

$$= AB$$

$$= X$$
